Question 1:

[12]

Write a java program and implement the following in the main method.

- 1) Declare an int type variable num and assign the last 2 digits of your registration number as the value of that variable.
- 2) If num is divisible by 5, print the next 20 even numbers (greater than num).
- 3) If num is not divisible by 5 but divisible by 7, then find the next 5 prime numbers that are greater than num and print those numbers.

Question 2:

[4]

What is the output of the following code segment? Show step by step changes.

```
int num1 = 4;
int num2 = 6;

int result = num1 + num2/5;
System.out.println( ++num1 * --result);
```

Question 3

[4]

Identify the errors in the following code and fix those errors.

```
for(i=0; i<10; i++) {
    int 203score = i;
    int sum += 203score;
    if (sum/2) {
        System.out.println("%d", sum);
        break;
    }
}

System.out.println("Completed the loop");
```

CT1: CSE 201 - Object-Oriented Programming I: Java (Sec D)**Time: 30 min****Mark: 20****Name:****ID:****Question 1:****[12]**

Write a java program and implement the following in the main method.

- 1) Create an array of size 8 and populate the array with items set to the digits of your birthdate. For example, if your birthdate is 30/12/2003, the array will be {3,0,1,2,2,0,0,3}
- 2) Find the highest element from the array.
- 3) If the highest number is even, calculate the summation of the odd numbers present in the array and print those numbers and summation.

Question 2:**[4]**

What is the output of the following code segment? Show step by step changes.

```
int num1 = 3;
int num2 = 6;

int result = (--num1 + num2++)/5;
System.out.println( --num1 * result);
```

Question 3**[4]**

Identify the errors in the following code and fix those errors.

```
for(int i=0; i<10; i++) {
    int 203score = i;
    sum += 203score;
    if (sum/2) {
        System.out.println(sum);
        break;
    }
}

if (i==10)
    System.out.println("Completed the loop");
```

Question 1:

[12]

Write a java program and implement the following in the main method.

- 1) Declare an int type variable num and assign your registration number as the value of that variable.
- 2) If num is even, find all the prime numbers between 1 to 100.
- 3) If num is odd, print all the numbers between 1 to 100 that are divisible by 3 and 4 but not 6.

Question 2:

[4]

What is the output of the following code segment? Show step by step changes.

```
int num1 = 3;
int num2 = 6;

int result = (num1 + num2)/5;
System.out.println( ++num1 * result);
```

Question 3

[4]

Identify the errors in the following code and fix those errors.

```
int ct1-score = 15;

if (ct1-score => 10)
    System.out.println("Passed");
    System.out.println("Keep it up");
else
    System.out.println("Failed");
```

Question 1:

[12]

Write a java program and implement the following in the main method.

- 4) Create an array of size 8 and populate the array with items set to the digits of your registration number. For example, if your registration number is 22201123, the array will be {2,2,2,0,1,1,2,3}
- 5) Find the summation of the items.
- 6) If summation is even, find the highest element of the array and print it.
- 7) If summation is odd, print the odd numbers of the array.

Question 2:

[4]

What is the output of the following code segment? Show step by step changes.

```
int num1 = 4;
int num2 = 6;

int result = num1 + num2/5;
System.out.println( ++num1 * result);
```

Question 3

[4]

Identify the errors in the following code and fix those errors.

```
int ct1-score = 15;

if (ct1-score => 10)
    System.out.println("Passed");
    System.out.println("Keep it up");
else
    System.out.println("Keep Trying.");
```

Question 1:

[12]

Write a java program and implement the following in the main method.

- 4) Create an array of size 8 and populate the array with items set to the digits of your birthdate. For example, if your birthdate is 23/12/2003, the array will be {2,3,1,2,2,0,0,3}
- 5) Find the highest element from the array.
- 6) If the highest number is even, find the even numbers present in the array and print those.
- 7) If the highest number is odd, print the odd numbers of the array.

Question 2:

[4]

What is the output of the following code segment? Show step by step changes.

```
int num1 = 3;
int num2 = 6;

int result = (++num1 + num2)/5;
System.out.println( ++num1 * result);
```

Question 3

[4]

Identify the errors in the following code and fix those errors.

```
int ct1-score = 15;

if (ct1-score => 10)
    System.out.println("Passed");
    System.out.println("Keep it up");
else
    System.out.println("Keep Trying.");
```
